

WALL MEASUREMENT GUIDE

Please follow the guide below. There are a few simple steps to help you take the correct measurements:

1. We recommend using a tape measure to measure the area required, all we need to start with is the width and height of your wall (not the size of shelving you require) and preferably for your measurements to be in centimetres or millimetres.

2. If you are measuring between walls or alcoves your side walls may not be exactly parallel, so it is a good idea to check the width at two different heights but also at the front and back of the alcove (1-4). If the widths are different provide us with the smallest dimensions and we will make the necessary adjustments for your shelves.

3. We may need to know the position of other fixed features including; switches, power sockets, radiators, windows and doors. The heights can be measured from the floor and widths measured from one end wall or a photo could be enough information to start with.

4. Please provide more details if you would like us to consider working around other furniture items. These can include; sofas, desks, storage units etc.
